Food as a fuel: quavers or rice cakes for the adventure?

You are going on an adventure to climb a mountain. You need to decide whether to pack quavers or rice cakes. In this practical you are going to investigate whether rice cakes or quavers contain the most energy in their chemical store.

Prediction:

What is your prediction before you begin?
Method:

**Step one**: set up the apparatus below on a heat proof mat. Put 10 ml of water into a boiling tube, clamp the tube and record the temperature of the water in the table.

1. 
2. 
3. 
4. 

**Step two**: measure the mass of the rice cake. Record it in the table below.

5. 

**Step three**: light the Bunsen. Using a pair of tongs put the piece of rice cake into the roaring blue flame until it catches fire.

6. 
7. 
8. 
9. 

**Step four**: return the Bunsen to the safety flame. Hold the food just underneath the boiling tube so that it warms the water. When the food stops burning place it into a beaker of water to prevent it from filling the room with smoke. Repeat the experiment according to the results table below.

1. 
2. 
3. 
4. 
5. 
6. 
7. 
8. 
9. 

### Results:

<table>
<thead>
<tr>
<th>Rice cake repeat</th>
<th>Mass (g)</th>
<th>Temperature of water before burning (°C)</th>
<th>Temperature of water after burning (°C)</th>
<th>Temperature rise (°C)</th>
<th>Temperature increase per gram of food (°C /g)</th>
</tr>
</thead>
<tbody>

### Questions:

1. Did the rice cake or quaver transfer the most energy to the water? How do you know?

2. Look at the packets for these foods, does your experimental result agree with the information on the packet? If they don’t agree, why not? Think about how energy is transferred from the food to the water.

3. If you were climbing a mountain, would you rather take rice cakes or quavers in your backpack? Use your results to justify your reasoning.
